

Your task is to find the readable strings from an exe file.

Write a program in language of your choice which takes the path to the binary file and outputs the extracted string from executable. You cannot embed third-party string extracting programs in you code.

How to implement:

- 1. Get any exe of your choice and read it in your code
- 2. You will check the exe, byte by byte, to see if byte falls between 0x20 and 0x7F (the range of ascii).
- 3. Then convert each byte into its corresponding ascii character.
- 4. Print it on the terminal.

Your output will look something like this:

Deliverables:

Create a document which contains explanation of your code along with screenshots of code and results.

Source code and runnable binary (if any) of your code
